

ZENITH BANK ZECATHON 6.0 · INTELLIGENT CUSTOMER PRODUCT MATCHING

Your money, *mapped*. One right move.

MoneyMap reads a customer's account — only what they allow — and suggests the one Zenith product that genuinely helps, with the reason in plain words. If nothing would help, it says so.

Live: moneymap-kuld.onrender.com

THE PROBLEM

Banks pick the product first, then look for someone to sell it to.

Wrong product

Offers go to groups, not people

A saver gets a loan offer. A student gets a premium card. A customer is offered something they already have.

Wrong moment

Timed by campaigns, not by life

Offers arrive when a campaign runs — not when salary lands, a goal is set or spending changes.

No reason given

So customers ignore them

Nobody explains why an offer fits. Customers tune out, trust drops and good products go unused.

The clues are already in the account: **salary dates, regular bills, money left over each month, and goals.**

Start from the customer's money. Suggest the one product that helps — *or none.*

Need first

MoneyMap works out what the customer needs, then looks for a product. Never the other way round.

One clear answer

One best match with why it fits and why now — or an honest “nothing needed”.

Sits beside Zenith

It reads with permission, decides and explains. It never moves money, opens accounts or approves credit.

Five things a normal *offer engine* doesn't do.

- **It can say no.** When no product would really help, it suggests nothing — so when it does speak, people listen.
- **It reads real Nigerian statements.** NIP, POS, WEB and ATM lines become income, bills and habits — nothing typed in by hand.
- **It explains everything.** Why it fits, why now, what it used, and why the other products weren't picked.
- **It waits for the right moment.** When salary lands it takes a fresh look — and messages at most once a week.
- **It never invents terms.** Only Zenith's published facts, each with its source. Everything else: “subject to Zenith Bank's current requirements”.

Five steps. Every one *visible* to the customer.

01

Understand

Income, spending, money left over and habits — only from what's allowed.

02

Find the need

Goals and patterns become needs, each with a strength score.

03

Match

Every Zenith product is scored. Published conditions are checked.

04

Decide

Only a score of 80+ is shown. Limits stop repeat offers.

05

Explain

Why it fits, why now, and why not the others.

Score = needs 30% · goal 20% · habits 15% · can-you-get-it 15% · timing 10% · preferences 10%. **Clear rules, not a black box** — a bank's risk team can check every weight.

READS THE REAL ACCOUNT

From bank statement lines to a clear picture.

NIP/BRIGHTPATH LOGISTICS LTD/SALARY

POS/SHOPRITE LEKKI/LA NG

IKEDC PREPAID/TOKEN 4512 8803 2210

NIP TRF TO ADAEZE NWOSU/RENT

WEB/BOLT.EU/RIDE LAGOS

Salary

Food

Electricity

Rent

Transport

Sarah, worked out from 138 transactions:

₦170,000

left over each month · ₦450,000 in · ₦280,000 out

Salary around the 25th, regular bills found, savings kept in her everyday account. Change one payment and the answer changes.

One strong match, with the *reason* in her words.

SAVE4ME

95% match. About **₦83,333 a month** reaches her **₦1,000,000** goal in 12 months — before interest, because Zenith sets the rates.

Why not the others: EazySave's balance cap is below her goal; Aspire is for students only.

YOUR ROUTE

Where you are, your next move, *your goal*.

An interactive map of the savings plan. Drag across it to see any month. Move the slider and the route — and the arrival date — change live.

The goal is the summit on a contour map: the same idea as the MoneyMap logo.

DEMO · TOLU, 35, SENIOR ACCOUNTANT

An honest “no”.

Tolu already saves with SAVE4ME and pays his credit card in full. No product would make his life better, so MoneyMap suggests nothing — and shows what it checked.

Life changes, the answer changes. Add a goal — a ₦6,000,000 car in 12 months — and Asset Finance appears.

When money lands, MoneyMap takes a fresh look — and usually *stays quiet*.

What happened	What MoneyMap did	Why
Sarah's salary lands	Sends one message: SAVE4ME	Strong match; saving on payday makes it easier to stick to
Sarah's bonus, same week	Checked — nothing sent	At most one message a week
Tolu's bonus	Checked — nothing sent	No product would really help
Income not shared	Checked — nothing sent	No permission, no action

Every check is logged — including each time MoneyMap chose silence — so the bank can see restraint, not just sales.

Better for customers. *Measurable* for the bank.

Target users

Salaried customers with money left over and a goal

Students who need simple, low-cost banking

Established customers — so they aren't over-sold

Zenith product and digital teams, through the bank view

Impact

Customers get fewer, better suggestions they understand

Zenith sells products that fit, so people keep them

Trust grows because MoneyMap explains — and can say no

Every result is tracked: useful rate, take-up and restraint

THE BANK VIEW

See what's *working*.

The real matching, run over 240 sample customers: how often suggestions are useful, taken up or held back, and which products meet which needs.

Turn a product off and every number updates — and it's never suggested again.

Your data. Your permission. *Your map.*

Five permissions

Each one separate, in plain words, and can be turned off at once.

Data rights

Download or delete everything from Settings, as the Nigeria Data Protection Act requires.

Secure by default

Encrypted sensitive fields, Zenith sign-in, rate limits, bot protection and a tamper-evident audit log.

No pressure selling

One message a week at most. A pause after repeated “no”s.

No invented terms

Only Zenith's published facts, each with its source.

Accessible

Readable in light and dark mode, checked on every screen.

Built, tested and *live today*.

Decision engine Clear rules plus weighted scoring in TypeScript; feedback stored to train a reviewed model later

Data analytics Reader for Nigerian bank statement lines: income, bills, spending, money left over

App React 19, Vite, Tailwind CSS · phone and desktop · dark mode

API Node.js + Fastify REST API with OpenAPI docs · signed webhooks

Data & security PostgreSQL with row-level security · AES-256 encryption · OIDC sign-in

Cloud Docker · cloud hosting · GitHub Actions on every change

112

automated tests of the rules, permissions, security and connections

280

browser and accessibility checks on phone and desktop

6

real Zenith products, published facts only, each with its source

From prototype to pilot: *configuration*, not a rebuild.

Done

1 · Prototype

Working customer app and bank view, live on the web, with realistic sample accounts.

Next

2 · Connect

Four small adapters: Zenith sign-in, statements and new-money alerts, app messages, and product requests.

Then

3 · Pilot

A small group of customers who opt in, in Zenith's cloud, after data-protection and risk review.

Then

4 · Measure & grow

Track useful rate, take-up and restraint. Tune the scoring, then add customers and products.

MoneyMap doesn't replace core banking, identity checks or credit decisions — **it sits beside them.**

The right product, for the right person, at the right moment — *for the right reason.*

Try it now: moneymap-kuld.onrender.com

Open “Demo” and load Sarah or Tolu.

Prototype with made-up sample customers. Product information comes from public sources and is subject to Zenith Bank's current requirements.
